Features

- High Performance, Low Power AVR® 8-Bit Microcontroller
- Advanced RISC Architecture
 - 131 Powerful Instructions Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers
 - Fully Static Operation
 - Up to 20 MIPS Throughput at 20 MHz
 - On-chip 2-cycle Multiplier
- Non-volatile Program and Data Memories
 - 4/8/16K Bytes of In-System Self-Programmable Flash (ATmega48/88/168)
 Endurance: 10,000 Write/Erase Cycles
 - Optional Boot Code Section with Independent Lock Bits

In-System Programming by On-chip Boot Program

True Read-While-Write Operation

256/512/512 Bytes EEPROM (ATmega48/88/168)

Endurance: 100,000 Write/Erase Cycles

- 512/1K/1K Byte Internal SRAM (ATmega48/88/168)
- Programming Lock for Software Security
- · Peripheral Features
 - Two 8-bit Timer/Counters with Separate Prescaler and Compare Mode
 - One 16-bit Timer/Counter with Separate Prescaler, Compare Mode, and Capture Mode
 - Real Time Counter with Separate Oscillator
 - Six PWM Channels
 - 8-channel 10-bit ADC in TQFP and QFN/MLF package
 - 6-channel 10-bit ADC in PDIP Package
 - Programmable Serial USART
 - Master/Slave SPI Serial Interface
 - Byte-oriented 2-wire Serial Interface
 - Programmable Watchdog Timer with Separate On-chip Oscillator
 - On-chip Analog Comparator
 - Interrupt and Wake-up on Pin Change
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated Oscillator
 - External and Internal Interrupt Sources
 - Five Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, and Standby
- I/O and Packages
 - 23 Programmable I/O Lines
 - 28-pin PDIP, 32-lead TQFP and 32-pad QFN/MLF
- · Operating Voltage:
 - 1.8 5.5V for ATmega48V/88V/168V
 - 2.7 5.5V for ATmega48/88/168
- Temperature Range:
 - -40°C to 85°C
- Speed Grade:
 - ATmega48V/88V/168V: 0 4 MHz @ 1.8 5.5V, 0 10 MHz @ 2.7 5.5V
 - ATmega48/88/168: 0 10 MHz @ 2.7 5.5V, 0 20 MHz @ 4.5 5.5V
- Low Power Consumption
 - Active Mode:
 - 1 MHz, 1.8V: 240µA
 - 32 kHz, 1.8V: 15µA (including Oscillator)
 - Power-down Mode:
 - 0.1µA at 1.8V

Summary

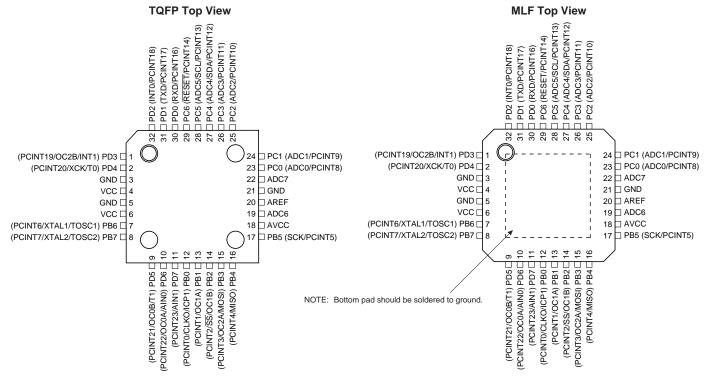

1. Pin Configurations

Figure 1-1. Pinout ATmega48/88/168

1.1 Disclaimer

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min and Max values will be available after the device is characterized.

2. Overview

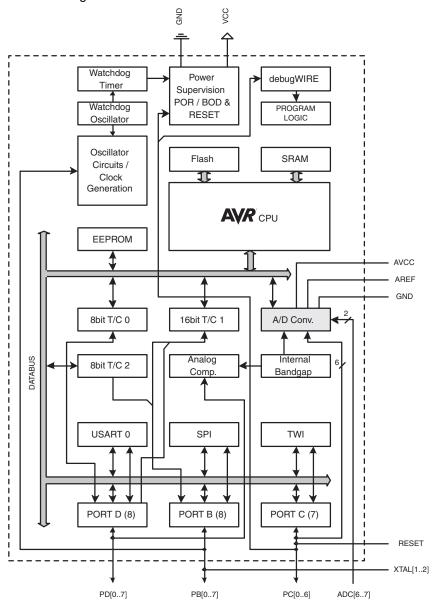

2

The ATmega48/88/168 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the

ATmega48/88/168 achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

2.1 Block Diagram

Figure 2-1. Block Diagram

The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega48/88/168 provides the following features: 4K/8K/16K bytes of In-System Program-mable Flash with Read-While-Write capabilities, 256/512/512 bytes EEPROM, 512/1K/1K bytes SRAM, 23 general purpose I/O lines, 32 general purpose working registers, three flexible

Timer/Counters with compare modes, internal and external interrupts, a serial programmable USART, a byte-oriented 2-wire Serial Interface, an SPI serial port, a 6-channel 10-bit ADC (8 channels in TQFP and QFN/MLF packages), a programmable Watchdog Timer with internal Oscillator, and five software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, USART, 2-wire Serial Interface, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or hardware reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except asynchronous timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the crystal/resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption.

The device is manufactured using Atmel's high density non-volatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed In-System through an SPI serial interface, by a conventional non-volatile memory programmer, or by an On-chip Boot program running on the AVR core. The Boot program can use any interface to download the application program in the Application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega48/88/168 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega48/88/168 AVR is supported with a full suite of program and system development tools including: C Compilers, Macro Assemblers, Program Debugger/Simulators, In-Circuit Emulators, and Evaluation kits.

2.2 Comparison Between ATmega48, ATmega88, and ATmega168

The ATmega48, ATmega88 and ATmega168 differ only in memory sizes, boot loader support, and interrupt vector sizes. Table 2-1 summarizes the different memory and interrupt vector sizes for the three devices.

Table 2-1. Memory Size Summary

Device	Flash	EEPROM	RAM	Interrupt Vector Size
ATmega48	4K Bytes	256 Bytes	512 Bytes	1 instruction word/vector
ATmega88	8K Bytes	512 Bytes	1K Bytes	1 instruction word/vector
ATmega168	16K Bytes	512 Bytes	1K Bytes	2 instruction words/vector

ATmega88 and ATmega168 support a real Read-While-Write Self-Programming mechanism. There is a separate Boot Loader Section, and the SPM instruction can only execute from there. In ATmega48, there is no Read-While-Write support and no separate Boot Loader Section. The SPM instruction can execute from the entire Flash.

2.3 Pin Descriptions

2.3.1 VCC

Digital supply voltage.

2.3.2 GND

Ground.

2.3.3 Port B (PB7:0) XTAL1/XTAL2/TOSC1/TOSC2

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Depending on the clock selection fuse settings, PB6 can be used as input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

Depending on the clock selection fuse settings, PB7 can be used as output from the inverting Oscillator amplifier.

If the Internal Calibrated RC Oscillator is used as chip clock source, PB7..6 is used as TOSC2..1 input for the Asynchronous Timer/Counter2 if the AS2 bit in ASSR is set.

The various special features of Port B are elaborated in "Alternate Functions of Port B" on page 78 and "System Clock and Clock Options" on page 27.

2.3.4 Port C (PC5:0)

Port C is a 7-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The PC5..0 output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

2.3.5 **PC6/RESET**

If the RSTDISBL Fuse is programmed, PC6 is used as an I/O pin. Note that the electrical characteristics of PC6 differ from those of the other pins of Port C.

If the RSTDISBL Fuse is unprogrammed, PC6 is used as a Reset input. A low level on this pin for longer than the minimum pulse length will generate a Reset, even if the clock is not running. The minimum pulse length is given in Table 9-1 on page 46. Shorter pulses are not guaranteed to generate a Reset.

The various special features of Port C are elaborated in "Alternate Functions of Port C" on page 82.

2.3.6 Port D (PD7:0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

The various special features of Port D are elaborated in "Alternate Functions of Port D" on page 85.

2.3.7 AV_{CC}

 AV_{CC} is the supply voltage pin for the A/D Converter, PC3:0, and ADC7:6. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter. Note that PC6..4 use digital supply voltage, V_{CC} .

2.3.8 AREF

AREF is the analog reference pin for the A/D Converter.

2.3.9 ADC7:6 (TQFP and QFN/MLF Package Only)

In the TQFP and QFN/MLF package, ADC7:6 serve as analog inputs to the A/D converter. These pins are powered from the analog supply and serve as 10-bit ADC channels.

3. Resources

- 1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
- 2. I/O Registers within the address range 0x00 0x1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
- 3. Some of the Status Flags are cleared by writing a logical one to them. Note that, unlike most other AVRs, the CBI and SBI instructions will only operate on the specified bit, and can therefore be used on registers containing such Status Flags. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
- 4. When using the I/O specific commands IN and OUT, the I/O addresses 0x00 0x3F must be used. When addressing I/O Registers as data space using LD and ST instructions, 0x20 must be added to these addresses. The ATmega48/88/168 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from 0x60 0xFF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.
- 5. Only valid for ATmega88/168

5. Instruction Set Summary

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ARITHMETIC AND I	LOGIC INSTRUCTIONS	3		•	•
ADD	Rd, Rr	Add two Registers	$Rd \leftarrow Rd + Rr$	Z,C,N,V,H	1
ADC	Rd, Rr	Add with Carry two Registers	$Rd \leftarrow Rd + Rr + C$	Z,C,N,V,H	1
ADIW	Rdl,K	Add Immediate to Word	Rdh:Rdl ← Rdh:Rdl + K	Z,C,N,V,S	2
SUB	Rd, Rr	Subtract two Registers	$Rd \leftarrow Rd - Rr$	Z,C,N,V,H	1
SUBI	Rd, K	Subtract Constant from Register	$Rd \leftarrow Rd - K$	Z,C,N,V,H	1
SBC	Rd, Rr	Subtract with Carry two Registers	$Rd \leftarrow Rd - Rr - C$	Z,C,N,V,H	1
SBCI	Rd, K	Subtract with Carry Constant from Reg.	Rd ← Rd - K - C	Z,C,N,V,H	1
SBIW	Rdl,K	Subtract Immediate from Word	Rdh:Rdl ← Rdh:Rdl - K	Z,C,N,V,S	2
AND	Rd, Rr	Logical AND Registers	$Rd \leftarrow Rd \bullet Rr$	Z,N,V	1
ANDI	Rd, K	Logical AND Register and Constant	$Rd \leftarrow Rd \bullet K$	Z,N,V	1
OR	Rd, Rr	Logical OR Registers	$Rd \leftarrow Rd \vee Rr$	Z,N,V	1
ORI	Rd, K	Logical OR Register and Constant	$Rd \leftarrow Rd \vee K$	Z,N,V	1
EOR	Rd, Rr	Exclusive OR Registers	Rd ← Rd ⊕ Rr	Z,N,V	1
COM	Rd	One's Complement	Rd ← 0xFF – Rd	Z,C,N,V	1
NEG	Rd	Two's Complement	Rd ← 0x00 – Rd	Z,C,N,V,H	1
SBR	Rd,K	Set Bit(s) in Register	Rd ← Rd v K	Z,N,V	1
CBR	Rd,K	Clear Bit(s) in Register	$Rd \leftarrow Rd \bullet (0xFF - K)$	Z,N,V	1
INC	Rd	Increment	Rd ← Rd + 1	Z,N,V	1
DEC TST	Rd Rd	Decrement Test for Zero or Minus	$Rd \leftarrow Rd - 1$ $Rd \leftarrow Rd \bullet Rd$	Z,N,V Z,N,V	1
	Rd	Clear Register	$Rd \leftarrow Rd \cdot Rd$ $Rd \leftarrow Rd \oplus Rd$	Z,N,V Z,N,V	1
CLR SER	Rd	Set Register	$Rd \leftarrow Rd \oplus Rd$ $Rd \leftarrow 0xFF$	None	1
MUL	Rd, Rr	Multiply Unsigned	$R1:R0 \leftarrow Rd \times Rr$	Z,C	2
MULS	Rd, Rr	Multiply Signed	$R1:R0 \leftarrow Rd \times Rr$	Z,C	2
MULSU	Rd, Rr	Multiply Signed with Unsigned	R1:R0 ← Rd x Rr	Z,C	2
FMUL	Rd, Rr	Fractional Multiply Unsigned	R1:R0 ← (Rd x Rr) << 1	Z,C	2
FMULS	Rd, Rr	Fractional Multiply Signed	$R1:R0 \leftarrow (Rd \times Rr) << 1$	Z,C	2
FMULSU	Rd, Rr	Fractional Multiply Signed with Unsigned	$R1:R0 \leftarrow (Rd \times Rr) << 1$	Z,C	2

8. Errata

8.1 Errata ATmega48

The revision letter in this section refers to the revision of the ATmega48 device.

8.1.1 Rev. B

No errata.

8.1.2 Rev A

- · Part may hang in reset
- Wrong values read after Erase Only operation
- Watchdog Timer Interrupt disabled
- Start-up time with Crystal Oscillator is higher than expected
- High Power Consumption in Power-down with External Clock
- · Asynchronous Oscillator does not stop in Power-down

1. Part may hang in reset

Some parts may get stuck in a reset state when a reset signal is applied when the internal reset state-machine is in a specific state. The internal reset state-machine is in this state for approximately 10 ns immediately before the part wakes up after a reset, and in a 10 ns window when altering the system clock prescaler. The problem is most often seen during In-System Programming of the device. There are theoretical possibilities of this happening also in run-mode. The following three cases can trigger the device to get stuck in a reset-state:

- Two succeeding resets are applied where the second reset occurs in the 10ns window before the device is out of the reset-state caused by the first reset.
- A reset is applied in a 10 ns window while the system clock prescaler value is updated by software.
- Leaving SPI-programming mode generates an internal reset signal that can trigger this case.

The two first cases can occur during normal operating mode, while the last case occurs only during programming of the device.

Problem Fix/Workaround

The first case can be avoided during run-mode by ensuring that only one reset source is active. If an external reset push button is used, the reset start-up time should be selected such that the reset line is fully debounced during the start-up time.

The second case can be avoided by not using the system clock prescaler.

The third case occurs during In-System programming only. It is most frequently seen when using the internal RC at maximum frequency.

If the device gets stuck in the reset-state, turn power off, then on again to get the device out of this state.

2. Wrong values read after Erase Only operation

At supply voltages below 2.7 V, an EEPROM location that is erased by the Erase Only operation may read as programmed (0x00).

Problem Fix/Workaround

If it is necessary to read an EEPROM location after Erase Only, use an Atomic Write operation with 0xFF as data in order to erase a location. In any case, the Write Only operation can be used as intended. Thus no special considerations are needed as long as the erased location is not read before it is programmed.

3. Watchdog Timer Interrupt disabled

If the watchdog timer interrupt flag is not cleared before a new timeout occurs, the watchdog will be disabled, and the interrupt flag will automatically be cleared. This is only applicable in interrupt only mode. If the Watchdog is configured to reset the device in the watchdog timeout following an interrupt, the device works correctly.

Problem fix / Workaround

Make sure there is enough time to always service the first timeout event before a new watchdog timeout occurs. This is done by selecting a long enough time-out period.

4. Start-up time with Crystal Oscillator is higher than expected

The clock counting part of the start-up time is about 2 times higher than expected for all start-up periods when running on an external Crystal. This applies only when waking up by reset. Wake-up from power down is not affected. For most settings, the clock counting parts is a small fraction of the overall start-up time, and thus, the problem can be ignored. The exception is when using a very low frequency crystal like for instance a 32 kHz clock crystal.

Problem fix / Workaround

No known workaround.

5. High Power Consumption in Power-down with External Clock

The power consumption in power down with an active external clock is about 10 times higher than when using internal RC or external oscillators.

Problem fix / Workaround

Stop the external clock when the device is in power down.

6. Asynchronous Oscillator does not stop in Power-down

The Asynchronous oscillator does not stop when entering power down mode. This leads to higher power consumption than expected.

Problem fix / Workaround

Manually disable the asynchronous timer before entering power down.

8.2 Errata ATmega88

The revision letter in this section refers to the revision of the ATmega88 device.

8.2.1 Rev. D

No errata.

8.2.2 Rev. B/C

Not sampled.

8.2.3 Rev. A

- Writing to EEPROM does not work at low Operating Voltages
- · Part may hang in reset

1. Writing to EEPROM does not work at low operating voltages

Writing to the EEPROM does not work at low voltages.

Problem Fix/Workaround

Do not write the EEPROM at voltages below 4.5 Volts.

This will be corrected in rev. B.

2. Part may hang in reset

Some parts may get stuck in a reset state when a reset signal is applied when the internal reset state-machine is in a specific state. The internal reset state-machine is in this state for approximately 10 ns immediately before the part wakes up after a reset, and in a 10 ns window when altering the system clock prescaler. The problem is most often seen during In-System Programming of the device. There are theoretical possibilities of this happening also in run-mode. The following three cases can trigger the device to get stuck in a reset-state:

- Two succeeding resets are applied where the second reset occurs in the 10ns window before the device is out of the reset-state caused by the first reset.
- A reset is applied in a 10 ns window while the system clock prescaler value is updated by software.
- Leaving SPI-programming mode generates an internal reset signal that can trigger this case.

The two first cases can occur during normal operating mode, while the last case occurs only during programming of the device.

Problem Fix/Workaround

The first case can be avoided during run-mode by ensuring that only one reset source is active. If an external reset push button is used, the reset start-up time should be selected such that the reset line is fully debounced during the start-up time.

The second case can be avoided by not using the system clock prescaler.

The third case occurs during In-System programming only. It is most frequently seen when using the internal RC at maximum frequency.

If the device gets stuck in the reset-state, turn power off, then on again to get the device out of this state.

8.3 Errata ATmega168

The revision letter in this section refers to the revision of the ATmega168 device.

8.3.1 Rev C

No errata.

8.3.2 Rev B

- Part may hang in reset
- 1. Part may hang in reset

Some parts may get stuck in a reset state when a reset signal is applied when the internal reset state-machine is in a specific state. 9. Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

9.1 Rev. 2545G-06/06

- 1. Added Addresses in Registers.
- 2. Updated "Calibrated Internal RC Oscillator" on page 33.
- 3. Updated Table 7-12 on page 35, Table 8-1 on page 39, Table 9-5 on page 54, Table 12-3 on page 78.
- 4. Updated "ADC Noise Reduction Mode" on page 40.
- 5. Updated note for Table 8-2 on page 43.
- 6. Updatad "Bit 2 PRSPI: Power Reduction Serial Peripheral Interface" on page 44.
- 7. Updated "TCCR0B Timer/Counter Control Register B" on page 104.
- 8. Updated "Fast PWM Mode" on page 121.
- 9. Updated "Asynchronous Operation of Timer/Counter2" on page 157.
- 10. Updated "SPI Serial Peripheral Interface" on page 161.
- 11. Updated "UCSRnA USART MSPIM Control and Status Register n A" on page 204.
- 12. Updated note in "Bit Rate Generator Unit" on page 213.
- 13. Updated "Bit 6 ACBG: Analog Comparator Bandgap Select" on page 239.
- 14. Updated Features in "Analog-to-Digital Converter" on page 241.
- 15. Updated "Prescaling and Conversion Timing" on page 244.
- 16. Updated "Limitations of debugWIRE" on page 258.
- 17. Added Table 27-5 on page 309.
- 18. Updated Figure 14-7 on page 122, Figure 28-44 on page 333.
- 19. Updated rev. A in "Errata ATmega48" on page 350.
- 20. Added rev. C and D in "Errata ATmega48" on page 350.

9.2 Rev. 2545F-05/05

- 1. Added Section 3. "Resources" on page 6
- Update Section 7.6 "Calibrated Internal RC Oscillator" on page 33.
- 3. Updated Section 26.8.3 "Serial Programming Instruction set" on page 299.
- 4. Table notes in Section 27.2 "DC Characteristics ATmega48/88/168*" on page 302 updated.
- 5. Updated Section 8. "Errata" on page 20.

9.3 Rev. 2545E-02/05

- 1. MLF-package alternative changed to "Quad Flat No-Lead/Micro Lead Frame Package QFN/MLF".
- 2. Updated "EECR The EEPROM Control Register" on page 21.
- Updated "Calibrated Internal RC Oscillator" on page 33.
- 4. Updated "External Clock" on page 35.

- 5. Updated Table 9-1 on page 46, Table 27-3 on page 307, Table 27-1 on page 304and Table 26-16 on page 299
- 6. Added "Pin Change Interrupt Timing" on page 66
- 7. Updated "8-bit Timer/Counter Block Diagram" on page 90.
- 8. Updated "SPMCSR Store Program Memory Control and Status Register" on page 261.
- 9. Updated "Enter Programming Mode" on page 288.
- 10. Updated "DC Characteristics ATmega48/88/168*" on page 302.
- 11. Updated "Ordering Information" on page 14.
- 12. Updated "Errata ATmega88" on page 21 and "Errata ATmega168" on page 22.

9.4 Rev. 2545D-07/04

- 1. Updated instructions used with WDTCSR in relevant code examples.
- 2. Updated Table 7-5 on page 31, Table 9-2 on page 48, Table 25-9 on page 280, and Table 25-11 on page 281.
- Updated "System Clock Prescaler" on page 36.
- Moved "TIMSK2 Timer/Counter2 Interrupt Mask Register" and "TIFR2 – Timer/Counter2 Interrupt Flag Register" to "8-bit Timer/Counter Register Description" on page 151.
- 5. Updated cross-reference in "Electrical Interconnection" on page 208.
- 6. Updated equation in "Bit Rate Generator Unit" on page 213.
- 7. Added "Page Size" on page 286.
- 8. Updated "Serial Programming Algorithm" on page 298.
- 9. Updated Ordering Information for "ATmega168" on page 16.
- 10. Updated "Errata ATmega88" on page 21 and "Errata ATmega168" on page 22.
- 11. Updated equation in "Bit Rate Generator Unit" on page 213.

9.5 Rev. 2545C-04/04

- 1. Speed Grades changed: 12MHz to 10MHz and 24MHz to 20MHz
- Updated "Maximum Speed vs. V_{CC}" on page 304.
- 3. Updated "Ordering Information" on page 14.
- 4. Updated "Errata ATmega88" on page 21.

9.6 Rev. 2545B-01/04

- 1. Added PDIP to "I/O and Packages", updated "Speed Grade" and Power Consumption Estimates in 9."Features" on page 1.
- Updated "Stack Pointer" on page 13 with RAMEND as recommended Stack Pointer value.
- 3. Added section "Power Reduction Register" on page 41 and a note regarding the use of the PRR bits to 2-wire, Timer/Counters, USART, Analog Comparator and ADC sections.
- 4. Updated "Watchdog Timer" on page 51.

- 5. Updated Figure 14-2 on page 130 and Table 14-3 on page 131.
- 6. Extra Compare Match Interrupt OCF2B added to features in section "8-bit Timer/Counter2 with PWM and Asynchronous Operation" on page 140
- 7. Updated Table 8-1 on page 39, Table 22-5 on page 256, Table 26-4 to Table 26-7 on page 283 to 285 and Table 22-1 on page 246. Added note 2 to Table 26-1 on page 282. Fixed typo in Table 11-1 on page 67.
- 8. Updated whole "ATmega48/88/168 Typical Characteristics Preliminary Data" on page 310.
- 9. Added item 2 to 5 in "Errata ATmega48" on page 20.
- 10. Renamed the following bits:
 - SPMEN to SELFPRGEN
 - PSR2 to PSRASY
 - PSR10 to PSRSYNC
 - Watchdog Reset to Watchdog System Reset
- 11. Updated C code examples containing old IAR syntax.
- 12. Updated BLBSET description in "SPMCSR Store Program Memory Control and Status Register" on page 271.
