Introduction

This document is intended to provide guidance when adding a router from the routeCONNECT MICA Series to your system.

The MICA Series is a range of UMTS / LTE routers enabling mobile broadband and machine to machine (M2M) industrial communication.

This document is aimed at engineers and describes the electrical characteristics, hardware and software operation of the MICA router.

About Siretta

Siretta, located in Reading, United Kingdom have been manufacturing antennas, cable assemblies and cellular modems for over 10 years. We supply our products globally to many of the world's leading organisations.

Whether you require an off the shelf or custom solution, Siretta has a wide portfolio of antenna, RF cable assemblies and modems to fit your application.

Our extensive knowledge and experience in the wireless market allows us to support a wide range of customer applications, focusing on frequencies typically within the 75MHz - 5.8GHz range. These encompass the HF, VHF, ISM, GSM/GPRS/3G/4G and GPS frequencies as well as industrial WLAN and VHF/UHF antenna/Wi-Fi antenna solutions.

With a heavy emphasis on design, we have a team of dedicated Application Engineers and Product Managers, backed up by Field Sales Engineers, who specialise in wireless applications.

We have made significant investments in R&D facilities which boast GPS hardware development equipment and a GSM Pico Cell on site, as well as development software and a comprehensive suite of Industrial, Scientific and Medical band, and non ISM band frequency products. We have many technology partners enabling us to keep at the forefront of the communications industry and offer class leading wireless solutions.

General Description

The Siretta MICA router series is a range of high speed industrial cellular routers in a compact enclosure. The MICA series is offered in 3G / UMTS and 4G / LTE forms giving reliable, secure and high speed wireless connectivity.

The MICA router series is a quality range designed for use in industrial environments needing high performance and a robust hard enclosure as standard.

The MICA router series has been designed for remote management, telemetry, condition monitoring, CCTV, ATMs, vending machine and other M2M applications.

The MICA router series is an ideal wireless data transfer device for high speed data applications transferring large amounts of data.

The MICA series, using the UMTS / 3G and 4G LTE networks, gives fast transfer speeds reaching up to 21Mbps download and up to 5.76Mbps upload for 3G and 50M upload and 100M download for 4G. The MICA router series has dual port Ethernet capability and a single SIM as standard, with 150Mbs data rate Wifi and GPS engine as optional versions.

This makes the compact MICA router series ideal for fleet tracking and device access management. In addition, the MICA router series is available with industrial grade VPN as an option, enabling a virtual private network service through the 3G / 4G connection and directly access the industrial server environment.

Features

- » Global 3G / UMTS bands
- » European 4G / LTE bands
- » High speed data via UMTS & LTE networks
- » Strong resistance to electromagnetic interference
- » Built-in watch dog, multi-link detection
- » Compact industrial design
- » Good heat and radiation endurance
- » Supports DHCP server
- » Supports DNS proxy and Dynamic DNS (DNSS)
- » Supports timing operation
- » Supports LED status indication
- » Supports APN and VDPN wireless private network access
- » Supports 802.11b/g/n WiFi, 150Mbps data rate
- » Local and remote management
- » SNMP network management, NTP support
- » WAN supports PPOE, Static IP DHCP Client (with 1 x WAN and 1 x LAN option)

Specifications

Table 1. Specifications of MICA Series routers

	MICA UMTS	MICA LTE
3G frequency band:	850, 900, 1900, 2100MHz	850, 900, 1900, 2100MHz
4G frequency band:		800/850, 900, 1800, 1900, 2100, 2600MHz
Dimensions:	103mm x 73.5mm x 23.5mm	103mm x 73.5mm x 23.5mm
Weight:	300g	300g
Supply voltage:	7.5 - 32VDC	7.5 - 32VDC
Operating temperature range:	-30 to 70°C	-30 to 70°C
Antenna interface:	SMA Female	2 x SMA Female

MICA Series Interface

Standard Router Features

Hardware

The MICA Series routers come with the following interfaces:

- » 2 x 10/100Mb Ethernet LAN
- » 1 x 3G SMA Female antenna interface
- » 2 x 4G SMA Female antenna interface
- » 1 x standard SIM/R-UIM interface
- » 1 x standard DC power interface

Optional Router Features

Optional Interfaces

The MICA Series have the following optional interfaces available:

- » 1 x 10/100Mb Ethernet LAN, 1 x 10/100Mb Ethernet WAN
- » 1 x GPS OR WiFi SMA female antenna interface*

Optional Technologies

The MICA Series have the following optional technologies available:

- » UMTS (Global 3G)
- » LTE (European 4G)

*WiFi and GPS are not available on a MICA simultaneously

Ordering Information

	MICA	X	X	X	XXXX
Range Identifier					
MICA = Industrial Router Range					
Optional Antenna Interfaces*					
G = GPS					
W = WiFi					
Number of Ethernet Ports					
1 = 1 x Ethernet LAN Port, 1 x Ethernet WAN Port					
2 = 2 x Ethernet LAN Ports					
Number of SIM Ports					
1 = 1 x SIM Port					
Technology					
UMTS = Global 3G					
LTE = European 4G					

Part Numbering Examples

- » MICA-11-UMTS = Global UMTS Industrial Router with 1 x Ethernet LAN, 1 x Ethernet WAN and 1 x SIM Port Interfaces
- » MICA-W21-LTE = European LTE Industrial Router with 2 x Ethernet LAN and 1 x SIM Port Interfaces, with WiFi

*WiFi and GPS are not available on a MICA simultaneously. If you do not require an additional antenna interface, leave this blank.

Dimensions

All dimensions are shown in mm.

Figure 1. MICA Series front - dimensions

Figure 2. MICA Series side - dimensions

MICA Series Images

Figure 3. 3D view of the MICA Router

Figure 4. Antenna and LED's

Figure 5. LAN, WAN/CON, Reset and Power Interfaces

Figure 6. SIM Cover

MICA LED Indicators

The state of the MICA Router is indicated by the status LEDs as shown in **table 2** below.

Figure 7. MICA LED's

Table 2. Device status LED

Silk screen	Color	Status	Indication
NET	Green	Blink	Strong signal
	Orange	Blink	Normal signal
	Red	Blink	Weak signal
		Blinking slowly (2s)	Logged in to network. LED color is matched with signal identification. (e.g. Green blink = strong online signal)
		Blinking slowly (0.5s)	Dialling
WLAN	Green	Solid light	WLAN port open but no data sending
	Green	Blinking quickly	Data is transmitting
	Green	Dark	WLAN port isn't opened
LAN	Green	Solid light	Connection OK
	Green	Blinking	Data sending
	Green	Dark	LAN not connected

Interfaces

LAN / WAN Port

As standard, the MICA Series is supplied with 2 x 10/100Mb LAN connections.

Optionally, the MICA router can be supplied with 1 x 10/100Mb LAN and 1 x WAN/CON connections. (Speak to your Siretta representative)

These connections can be used to connect the router directly to a computer, to transmit wireless data or for debug testing.

Figure 8. MICA LAN / WAN Connection

SIM Socket

The MICA Series supports fixed SIMs locked to a network and roaming SIMs which can operate on more than one network within the home country. This allows for least cost routing for roaming mobile data and machine to machine applications where signal strength is variable in any given area and network selection is required.

The MICA also supports global roaming SIMs which will work with any network it can detect, at home or abroad and can be chosen for best performance.

The MICA routers can are single SIM, supporting 1.8/3/5V with automatic SIM detection.*

Figure 9. SIM holder

SIM Requirements

SIM services available for the MICA series include:

- » 3G UMTS (850/900/1900/2100MHz)
- » SMS
- » 4G LTE (800/850, 900, 1800, 1900, 2100, 2600MHz)

Figure109. SIM card dimensions

*To insert SIM card, remove blue protective shield and insert. Replace shield once SIM is inserted.

Antenna Connectors

Figure 11. Antenna connectors

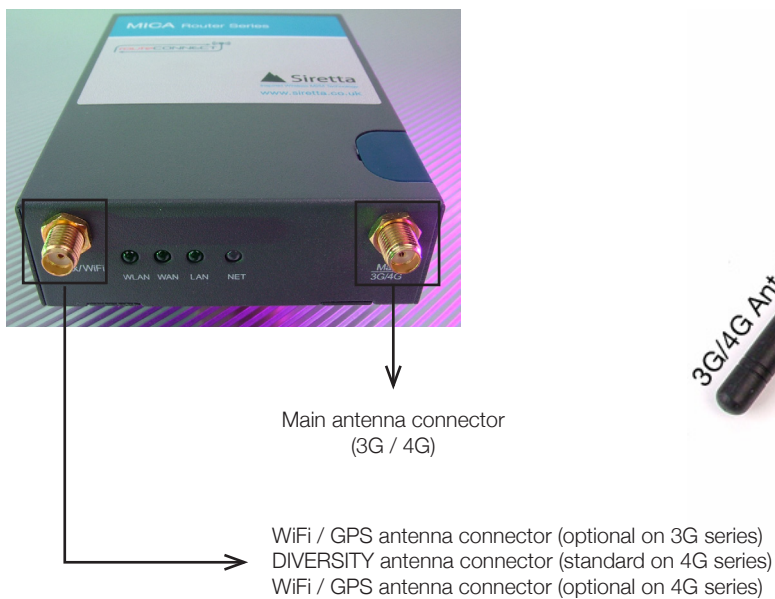

Figure 12. MICA Antennas*

Antenna Placement

When in service the antenna should be placed away from electronic devices or other antennas. The recommended minimum distance between adjacent antennas, operating on a similar radio band, is at least 50cm.

Antenna Connection Cable

If a cable is used to connect the antenna to the router this cable must be a high quality low loss cable. The cable and any connectors used should have 50 ohms impedance.

*Antennas only supplied when MICA is purchased with accessories.

Main Antenna

A female SMA connector is provided to allow connection of 3G / LTE. For optimum performance the antenna assembly connected to this router is required to have the following characteristics:

- » For 3G UMTS operation specified operation in the following bands: UMTS 850/900/1900/2100MHz
- » For 4G LTE operation specified operation in the following bands: LTE 800/850, 900, 1800, 1900, 2100, 2600MHz
- » The characteristic impedance on any antenna or cable assembly attached to this router should be 50 ohms
- » The antenna must be capable of handling a minimum of 2W output power
- » The VSWR should be less than 3:1 to avoid damage to the router

GPS Antenna

A female SMA connector is provided to allow connection of optional GPS. For optimum performance the antenna assembly connected to this router is required to have the following characteristics:

- » For GPS operation specified operation in the following bands: 1575.42 MHz
- » The characteristic impedance on any antenna or cable assembly attached to this router should be 50 ohms
- » The antenna must be capable of handling a minimum of 2W output power
- » The VSWR should be less than 3:1 to avoid damage to the router

WiFi Antenna

A female SMA connector is provided to allow connection of optional WiFi. For optimum performance the antenna assembly connected to this router is required to have the following characteristics:

- » For WiFi operation specified operation in the following bands: 2.4GHz
- » The characteristic impedance on any antenna or cable assembly attached to this router should be 50 ohms
- » The antenna must be capable of handling a minimum of 2W output power
- » The VSWR should be less than 3:1 to avoid damage to the router

GPS

GPS Performance (MICA-G Variants)

- » Advanced real time hardware correlation engine for enhanced sensitivity (better than -165dBm for A-GPS)
- » Fast Acquisition giving rapid Time-to-First-Fix (TTFF)
- » Capability to monitor up to 28 channel
- » Stand Alone and Assisted mode
- » Integrated LNA

WiFi

WiFi Performance (MICA-W Variants)

- » Standard: IEEE 802.11b/g/n
- » WEP, WPA and WPA2 encryption
- » Standard 150Mbps

Power

Power Connector

This connector is used for supplying DC power to the router.

Figure 13. Power connector

Power connector

Power Supply Requirements

A DC power supply must be connected to the power input.

Table 3. Characteristics of power input

	MICA Series
Idle:	80mA @ +12VDC
Communicating:	320mA : +12VDC
Power supply:	5 - 36VDC

Switching the Router ON/OFF

Power on the MICA

The MICA router is automatically powered on when powered is supplied.

Power off the MICA

The MICA router is automatically powered off when power is removed.

Restart the MICA

Press and hold reset button for at least 5 seconds.

Figure 14. Reset button

Reset button

Installation

Considerations for Installations Incorporating the MICA

There are several conditions which need to be taken into consideration when designing your application as they might affect the router and its functionality. These are:

Environmental conditions: The router must be installed so that the environmental conditions stated such as temperature, humidity and vibration are satisfied. Additionally, the electrical specifications must not be exceeded.

Signal strength: The router/antenna has to be placed in a position that ensures sufficient signal strength. To improve signal strength, the antenna can be moved to a more elevated position. Signal strength usually depends on how close the router is to the base station. You must ensure that the location at which you intend to use the router is within the network coverage area. Degradation in signal strength can be the result of a disturbance from another source, for example an electronic device in the immediate vicinity.

When considering the location for the router and antenna placement, you must consider received signal strength as well as cable length as long cable runs can attenuate the received signal strength.

Connections of components to MICA Series routers: The system integrator is responsible for the final system solution. If external components are incorrectly designed or installed it may cause radiation limits to be exceeded. For instance, improper cable connections or incorrectly installed antennas can disturb the network and lead to router malfunction.

Network and subscription: Before your application is used, you must ensure that your chosen network provides the necessary telecommunication services. Contact your service provider to obtain the necessary information.

- » If you intend to use SMS in the application, ensure this is included in your subscription.

Power Supply Installations

- » Use a high-quality power supply with short leads. This ensures that the voltages at the connector pins are within the specified range, especially during the maximum peak current of approximately 2A.
- » When the router is powered from a battery or a high current supply, connect a fast 1.25A fuse in line with the positive supply. This protects the power cabling and router from damage.

Securing the Router

Before securing the router please take into account the amount of additional space required for the mating connectors and cables that will be used with the router in the application.

- » Where access is restricted, it may be easier to connect all the cables to the router prior to placing it in the application.

Safety and Product Care

Please read the information on this page and **page 19** 'Installation' before you begin your system integration.

General Precautions

- » The MICA series routers are a standalone item designed for indoor use only. For use outside it must be installed in a weatherproof enclosure.
- » Do not exceed the environmental and electrical limits as specified.
- » Avoid exposing the router to lit cigarettes, naked flames or to extreme hot or cold temperatures.
- » Never try to dismantle the router. There are no components inside the router that can be serviced by the user. If you attempt to dismantle the router, you will invalidate the warranty.
- » The MICA series router must not be installed or located where the surface temperature of the enclosure may exceed 85°C.
- » All cables connected to the MICA series routers must be secured or clamped, immediately adjacent to the routers connectors, to provide strain relief and to avoid transmitting excessive vibration to the router in the installation.
- » To protect power supply and to meet the fire safety requirements when the router is powered from a battery or a high current supply, connect a fast 1.25A fuse in line with the positive supply.
- » Do not connect any incompatible component or product to the MICA series router.

SIM Card Precautions

Before handling the SIM card in your application, ensure that you have discharged any static electricity. Use standard precautions to avoid electrostatic discharges.

- » When designing a MICA series router into your application, the accessibility of the SIM card should be taken into account so that it can be removed or changed.
- » We always recommend that you have the SIM card protected by a PIN code. This will ensure that the SIM card cannot be used by an unauthorized person.

Antenna Precautions

If the antenna is to be mounted outside, always consider the risk of a lightning strike. Follow the instructions provided by the antenna manufacturer. In addition please observe the following:

- » Never connect more than one router to a single antenna. The router can be damaged by radio frequency energy from the transmitter of another router.
- » With all mobile station equipment, the antenna of the router emits radio frequency energy. To avoid EMI (electromagnetic interference) you must determine if the application or equipment in the application's proximity, needs further protection against radio emission and the disturbances it might cause. Protection is secured either by shielding the surrounding electronics or by moving the antenna away from the electronics and external signal cables.
- » The router and antenna may be damaged if either come into contact with ground potentials other than the ground potential used in your application. Beware, ground potentials can vary significantly between hardware platforms.

Exposure to RF Energy

There has been some public concern about possible health effects of using GSM equipment in close proximity to a person or body. Although research on health effects from RF energy has focused for many years on the current RF technology, research has begun on new radio technologies, such as GSM and UMTS. After existing research had been reviewed, and after compliance to all applicable safety standards has been tested, it has been concluded that the ZETA series router is fit for use.

If you are concerned about exposure to RF energy, there are a number of things you can do to minimize exposure. Obviously, limiting the duration of time near a device will reduce your exposure to RF energy. In addition, you can reduce RF exposure by operating your router efficiently by adhering to the following guidelines:

Electronic devices: Most electronic equipment, for example in hospitals and motor vehicles is shielded from RF energy. However, RF energy may affect some malfunctioning or improperly shielded electronic equipment.

Vehicle electronic equipment: Check your vehicle manufacturer's representative to determine if any on board electronic equipment is adequately shielded from external RF energy.

MICA Series

Hardware Reference Manual

Medical electronic equipment: Consult the manufacturer of any personal medical devices (such as pacemakers, hearing aids, etc.) to determine if they are adequately shielded from external RF energy.

Turn your router OFF in health care facilities when any regulations posted in the area instruct you to do so. Hospitals or health care facilities may be using RF monitoring equipment.

Aircraft: Turn your router OFF before boarding any aircraft. To prevent possible interference with aircraft systems, Federal Aviation Administration (FAA) regulations require you to have permission from a crewmember to use your router equipment whilst the plane is on the ground. To prevent interference with cellular systems, local RF regulations prohibit using your router whilst in the air.

Blasting areas: To avoid interfering with blasting operations, turn your router OFF when in a “blasting area” or in areas posted: “turn off two-way radio”. Construction crew often uses remote control RF devices to set off explosives.

Potentially explosive atmospheres: Turn your router OFF when in any area with a potentially explosive atmosphere. It is rare, but your routers or their accessories could generate sparks. Sparks in such areas could cause an explosion or fire resulting in bodily injury or even death.

Areas with a potentially explosive atmosphere are often, but not always, clearly marked. They include fuelling areas such as petrol stations, below deck on boats, fuel or chemical transfer or storage facilities and areas where the air contains chemicals or particles, such as grain, dust or metal powders. Do not transport or store flammable gas, liquid or explosives, in the compartment of your vehicle, which contains your router or accessories. Before using your router in a vehicle powered by liquefied petroleum gas (such as propane or butane) ensure that the vehicle complies with the relevant fire and safety regulations of the country in which the vehicle is to be used.

Safety Recommendations

PLEASE READ CAREFULLY

Be sure the use of this product is allowed in the country intended and the environment required. The use of this product may be dangerous and has to be used with caution in the following areas:

- » Where it can interfere with other electronic devices in environments such as hospitals, airports, aircrafts, etc
- » Where there is risk of explosion such as gasoline stations, oil refineries, gas works etc

It is responsibility of the user to enforce the country regulation and the specific environment regulation.

Do not disassemble the product, any mark of tampering will compromise the warranty.

We recommend following the instructions of this hardware user guide for the correct wiring of the product. The product has to be supplied with a stabilized voltage source and the wiring has to conform to the security and fire prevention regulations.

The product has to be handled with care, avoid any direct contact with the pins because electrostatic discharge may damage the product. The same precautions have to be observed for the SIM card installation.

The system integrator is responsible for the complete functionality of the final product. Therefore, care has to be taken with the external components used with the module, as well as any installation issue.

Should there be any doubt, please refer to the technical documentation and the regulations in force. Every module has to be equipped with a suitable antenna with characteristics which match the product requirements.

The antenna has to be installed with care in order to avoid any interference with other electronic devices and has to guarantee a minimum distance from the body (20 cm). In case this requirement cannot be satisfied, the system integrator has to assess the final product against the SAR regulation EN 50360.

Approvals

- » **CE** - European Conformity
- » **RoHS** - Restriction of the Use of Certain Hazardous Substances Compliant
- » **CCC** - China Compulsory Certificate
