# LM158-LM258-LM358 LM158A-LM258A-LM358A

## Low Power Dual Operational Amplifiers

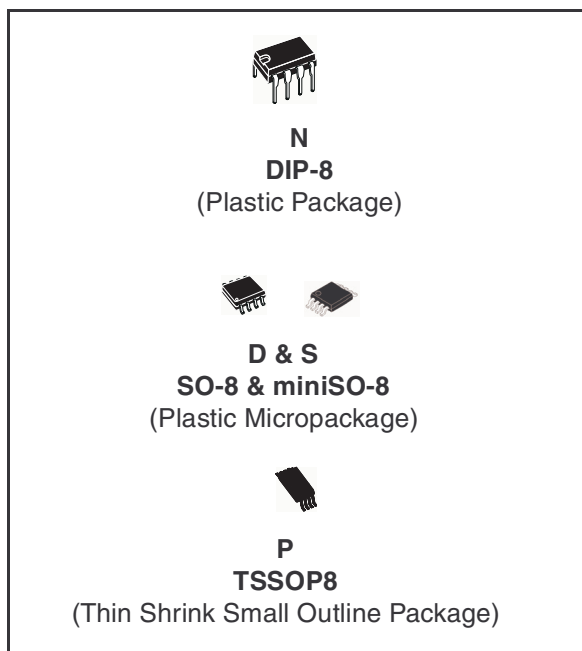

- Internally frequency compensated
- Large DC voltage gain: 100dB
- Wide bandwidth (unity gain): 1.1MHz (temperature compensated)
- Very low supply current/op (500 $\mu$ A) essentially independent of supply voltage
- Low input bias current: 20nA (temperature compensated)
- Low input offset voltage: 2mV
- Low input offset current: 2nA
- Input common-mode voltage range includes ground
- Differential input voltage range equal to the power supply voltage
- Large output voltage swing 0V to ( $V_{CC} - 1.5V$ )

### Description

These circuits consist of two independent, high-gain, internally frequency-compensated which were designed specifically to operate from a single power supply over a wide range of voltages. The low power supply drain is independent of the magnitude of the power supply voltage.

Application areas include transducer amplifiers, DC gain blocks and all the conventional op-amp circuits which now can be more easily implemented in single power supply systems. For example, these circuits can be directly supplied with the standard +5V which is used in logic systems and will easily provide the required interface electronics without requiring any additional power supply.

In the linear mode the input common-mode voltage range includes ground and the output voltage can also swing to ground, even though operated from only a single power supply voltage.

LM358AST				K404

# 1 Absolute Maximum Ratings

**Table 1. Key parameters and their absolute maximum ratings**

Symbol	Parameter	LM158,A	LM258,A	LM358,A	Unit
$V_{CC}$	Supply voltage	+/-16 or 32			V
$V_i$	Input Voltage	-0.3 to +32			V
$V_{id}$	Differential Input Voltage	+32			V
$P_{tot}$	Power Dissipation <sup>(1)</sup>	500			mW
	Output Short-circuit Duration <sup>(2)</sup>	Infinite			
$I_{in}$	Input Current <sup>(3)</sup>	50			mA
$T_{oper}$	Operating Free-air Temperature Range	-55 to +125	-40 to +105	0 to +70	°C
$T_{stg}$	Storage Temperature Range	-65 to +150			°C
$T_j$	Maximum Junction Temperature	150			°C
$R_{thja}$	Thermal Resistance Junction to Ambient <sup>(4)</sup> SO8 TSSOP8 DIP8 miniSO8	125 120 85 190			°C/W
ESD	HBM: Human Body Model <sup>(5)</sup>	300			V
	MM: Machine Model <sup>(6)</sup>	200			V
	CDM: Charged Device Model	1.5			kV

- Power dissipation must be considered to ensure maximum junction temperature ( $T_j$ ) is not exceeded.
- Short-circuits from the output to  $V_{CC}$  can cause excessive heating if  $V_{CC} > 15V$ . The maximum output current is approximately 40mA independent of the magnitude of  $V_{CC}$ . Destructive dissipation can result from simultaneous short-circuit on all amplifiers.
- This input current only exists when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistor becoming forward biased and thereby acting as input diodes clamps. In addition to this diode action, there is also NPN parasitic action on the IC chip. this transistor action can cause the output voltages of the Op-amps to go to the  $V_{CC}$  voltage level (or to ground for a large overdrive) for the time duration than an input is driven negative. This is not destructive and normal output will set up again for input voltage higher than -0.3V.
- Short-circuits can cause excessive heating. Destructive dissipation can result from simultaneous short-circuit on all amplifiers
- Human body model, 100pF discharged through a 1.5k $\Omega$  resistor into pin of device.
- Machine model ESD, a 200pF cap is charged to the specified voltage, then discharged directly into the IC with no external series resistor (internal resistor < 5 $\Omega$ ), into pin to pin of device.

## 2 Typical Application Schematic

SR	Slew Rate $V_{CC} = 15V$ , $V_i = 0.5$ to $3V$ , $R_L = 2k\Omega$ , $C_L = 100pF$ , unity Gain	0.3	0.6		0.3	0.6		$V/\mu s$
GBP	Gain Bandwidth Product $V_{CC} = 30V$ , $f = 100kHz$ , $V_{in} = 10mV$ , $R_L = 2k\Omega$ , $C_L = 100pF$	0.7	1.1		0.7	1.1		MHz
THD	Total Harmonic Distortion $f = 1kHz$ , $A_v = 20dB$ , $R_L = 2k\Omega$ , $V_o = 2V_{pp}$ , $C_L = 100pF$ , $V_O = 2V_{pp}$		0.02			0.02		%
$e_n$	Equivalent Input Noise Voltage $f = 1kHz$ , $R_s = 100\Omega$ , $V_{CC} = 30V$		55			55		$\frac{nV}{\sqrt{Hz}}$
$DV_{io}$	Input Offset Voltage Drift		7	15		7	30	$\mu V/^\circ\text{C}$
$DI_{io}$	Input Offset Current Drift		10	200		10	300	$pA/^\circ\text{C}$
$V_{O1}/V_{O2}$	Channel Separation - note <sup>(4)</sup> $1kHz \leq f \leq 20kHz$		120			120		dB

- $V_O = 1.4V$ ,  $R_s = 0\Omega$ ,  $5V < V_{CC}^+ < 30V$ ,  $0 < V_{ic} < V_{CC}^+ - 1.5V$
- The direction of the input current is out of the IC. This current is essentially constant, independent of the state of the output so no loading change exists on the input lines.
- The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is  $V_{CC}^+ - 1.5V$ , but either or both inputs can go to +32V without damage.
- Due to the proximity of external components insure that coupling is not originating via stray capacitance between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.

## 5 Package Mechanical Data

In order to meet environmental requirements, ST offers these devices in ECOPACK<sup>®</sup> packages. These packages have a Lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: [www.st.com](http://www.st.com).
